Clinician: Dr. Fiona Collins

Problem:

Many patients experience dentinal hypersensitivity. This is especially true of adult patients who have received periodontal therapy, or have extensive gingival recession and exposed root surfaces, or xerostomia.

Solution:

Riva Star is as a new generation SDF (silver diamine fluoride) desensitizer that immediately relieves tooth sensitivity for adults over 21 years of age. **Riva Star's** key ingredients are silver diamine fluoride (SDF) and potassium iodide (KI). Unlike any other SDF based system, **Riva Star's** two-step patented procedure minimizes the risk of staining the tooth black. This process results in a more esthetically acceptable tooth colored appearance for the patient. The use of **Riva Star** enhances bonding of glass ionomers to dentin. **Riva Star** provides a quick, painless and easy treatment option for adults and the elderly.

Note: SDI Limited has been successful in registering Riva Star in several key Latin American countries such as Brazil, Peru and Colombia as well as in Canada as an anti-caries agent. In Europe and Australia it is registered for the treatment of hypersensitivity.
